

What is Sense?

The Sense Home Energy Monitor is a small device installed in your home's electrical panel that allows you to monitor your energy use in real-time. Sense can also detect and track many of the different appliances in your home to show you what is consuming electricity, how much it's costing you, and when it turns on or off.

Download the mobile apps at sense.com/app to create your account and get started!

How can Sense help me?

Save money by monitoring your energy use in real-time.

Identify devices that may be inefficient or not working properly.

Receive alerts when your energy usage increases.

Using Sense with solar?

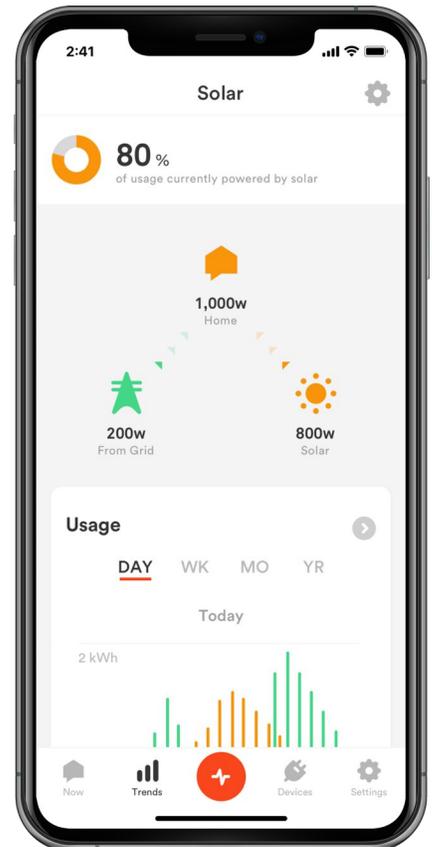

With the Sense app, you can view a real-time comparison of how much energy is being used vs. how much solar is being produced. Sense Solar shows you when your home is being powered by either solar or your utility. This enables you to save money by managing your electricity usage to match your solar production.

What can I expect from Sense?

In the first few days, your Sense monitor will go through a self-check process to verify that all energy readings are accurate. Following this, you can start viewing your home's energy usage and solar production right away. Over time, Sense will start to recognize the usage patterns of individual devices within your home. Sense will notify you via push notification and/or email when new devices are detected. For each device that Sense discovers, you can add a name, category, and even custom notifications to let you know when it turns on or off.

What if I have a question about my Sense monitor?

Meet Sense.

See what's up, know what's on.

Check out these Sense features:

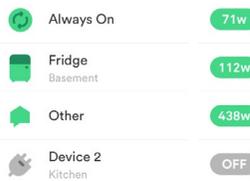

Power Meter: your home's real-time energy

Walk around the house, turn devices on and off, and see how much energy they use by looking at the Power Meter. Try unplugging a few devices too!

Trends: your energy history

Don't wait until the end of the month to see how much energy your home used. Track energy usage by day, week, month, or billing cycle in the Trends screen.

Devices list: what Sense has discovered

As Sense listens to your home, it detects the energy signatures of some individual devices. Sense will often name them "motor", "heat", "light", or "device" and then you can label it.

Bubbles: what's on right now

Visualize what devices are on right now and how much energy they are using. You can tap a bubble to view wattage, or double-tap to find out more about that device.

Timeline: what's happening

The timeline shows you when things happen at home. You can customize what appears on your timeline in the Device Settings screen.

Alert me if my

iron is on

for 15m

Notifications: set your own alerts

Create custom notifications to receive alerts when a device turns on or off. Did you leave the oven on? Did the garage door open?
